🧩 Dedentify

- Very few people are following GDPR/CCPA laws at small scale tech companies, but enforcement will eventually trickle down.
- Dedentify allows users to transmit arbitrary data, within an organization and to external organizations, while enforcing cutting edge differential privacy en route. It's like having a very cheap data privacy consultant on call.
- Nathaniel has seen first hand how common it is for PID to be shared. What is needed is a very low barrier to entry that doesn't negatively impact the value of the data itself.
- By performing simple transformations as data is en route, we eliminate compliance risk
- Prototype built in python
